

Co-Cog development and testing:

A co-produced **digital system** for monitoring cognition, health, and wellbeing after dementia or MCI diagnosis

Development: Co-Cog is a digital monitoring system, **co-designed alongside people living with dementia(PLWD)/MCI, carers, and professionals**, to help services recognise changes in health, wellbeing, cognition, and carer strain. **Pilot testing:** Co-Cog was acceptable and easy to use for PLWD/MCI and carers. It can translate repeated home-based self-reports into workforce-facing triage data. **Next steps:** diverse co-design → definitive efficacy trial.

INTRODUCTION & APP DESIGN

Post-diagnostic services for people living with dementia (PLWD) are often fragmented, poor quality, or absent.^{1,2} This contributes to delayed intervention, avoidable deterioration, and greater reliance on crisis-driven care.^{3,4} Co-Cog is designed to address this gap; see development stages:

Co-Cog has two linked components: (1) an **app for PLWD/MCI and care partners**, for brief, repeated home-based monitoring of health, wellbeing, and cognition, and (2) a **workforce-facing dashboard** with a **(3) triage system** to support clinical oversight.

PILOT STUDY METHODS

Participants: 41 dyads of PLWD/MCI & carer (21 PLWD, 20 MCI)
NHS sites: Sussex and Yorkshire
Weekly Co-Cog use at home over 4 weeks
Mixed-methods: survey, interview, app-data

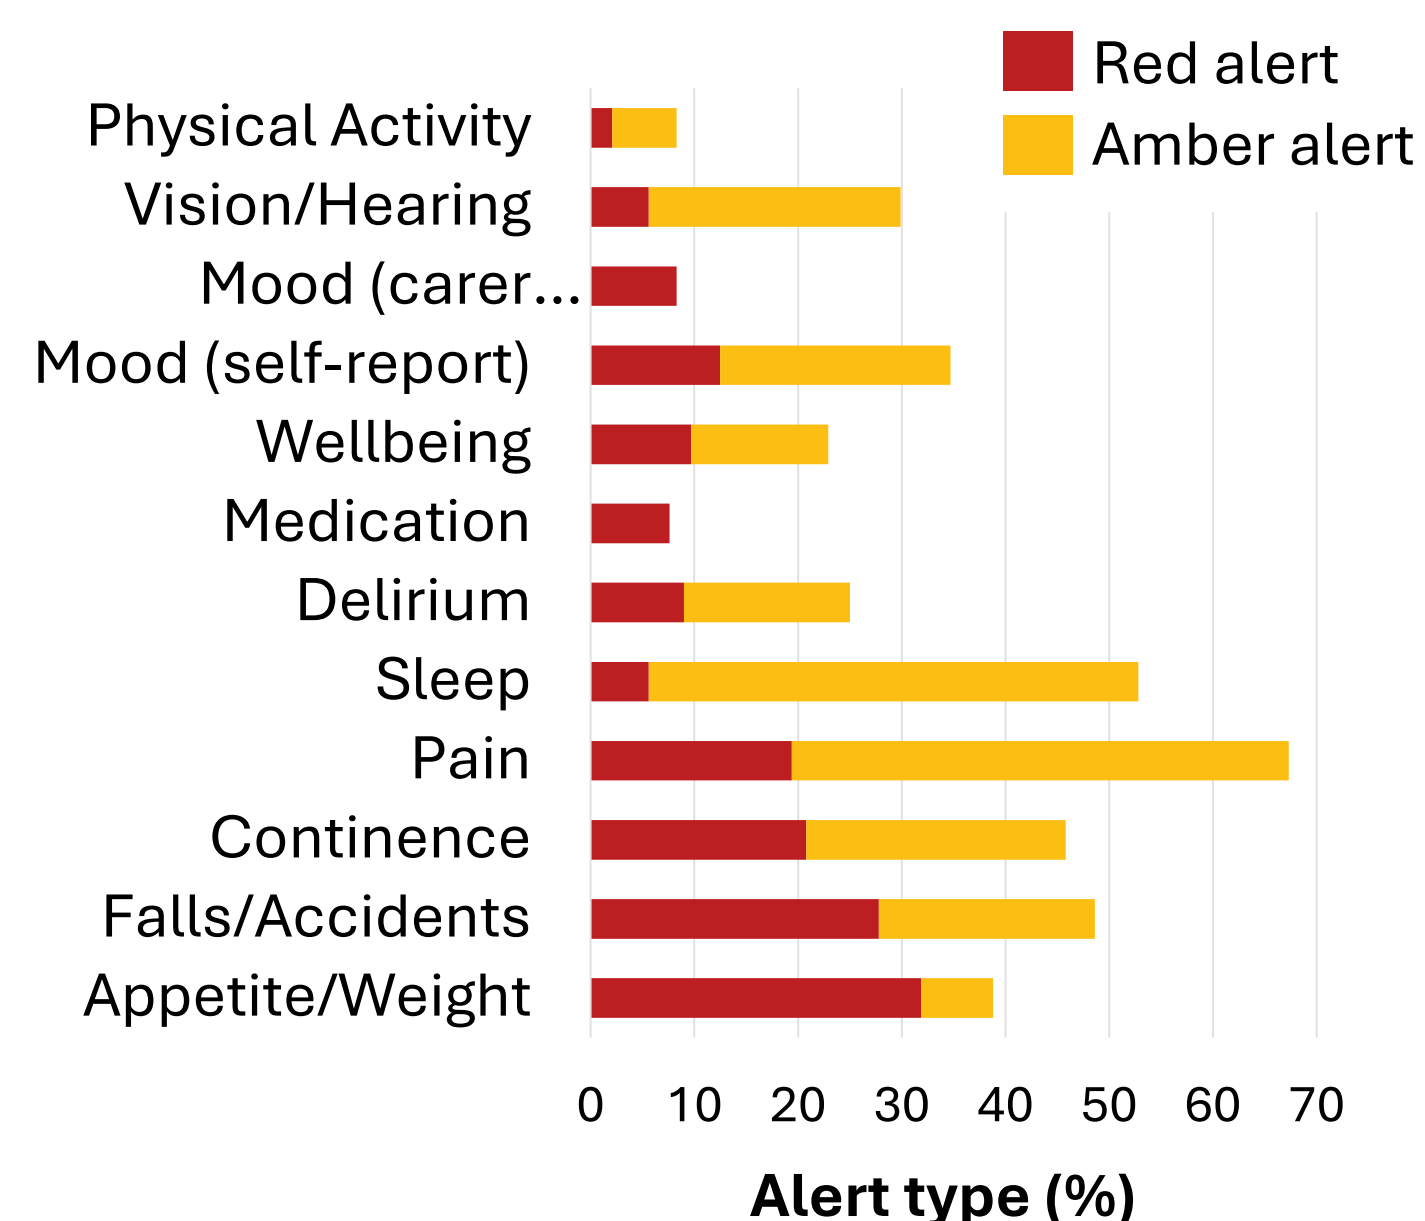

QUALITATIVE OUTCOMES

Ease of use / growing independence (34 refs):
Once learned, participants found the app quick and manageable.
PLWD achieved independent use after a couple of sessions.

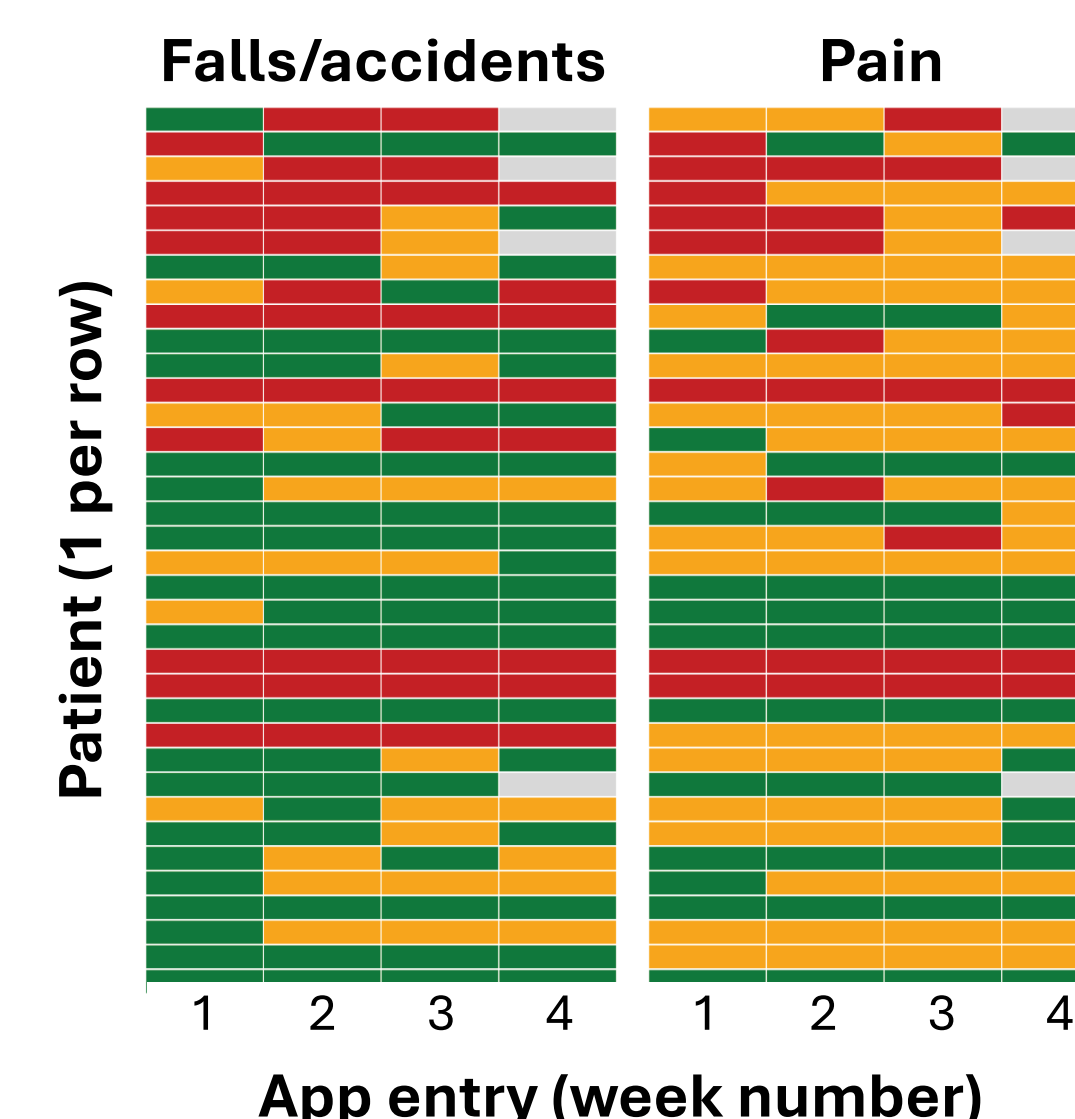

‘TRAFFIC LIGHT’ TRIAGE

97% of participants showed alert status change in ≥1 domains across four sessions

Across four sessions 75% triggered ≥1 red alert, 98% triggered ≥1 amber alert

Alerts: Green Amber Red No entry
